Search Notes

Examiner Le,

Please find attached results of the search you requested. Various components of the invention as spelt out in the claims and search request form were searched in REGISTRY and CAPLUS databases.

For your convenience, titles of hits are listed to help you peruse them quickly, followed by a detailed printout of records.

Please let me know if you have any questions.
Thanks.

STIC Search Results Feedback Form

EIC17000

Questions about the scope or the results of the search? Contact *the EIC searcher or contact:*

Kathleen Fuller, EIC 1700 Team Leader

Voluntary Results Feedback Form

- I am an examiner in Workgroup: Example: 1713
➤ Relevant prior art **found**, search results used as follows:

- ☐ 102 rejection
- ☐ 103 rejection
- ☐ Cited as being of interest.
- ☐ Helped examiner better understand the invention.
- ☐ Helped examiner better understand the state of the art in their technology.

Types of relevant prior art found:

- ☐ Foreign Patent(s)
- ☐ Non-Patent Literature
(journal articles, conference proceedings, new product announcements etc.)

➤ Relevant prior art **not found**:

- ☐ Results verified the lack of relevant prior art (helped determine patentability).
- ☐ Results were not useful in determining patentability or understanding the invention.

Comments:

Drop off or send completed forms to EIC1700 REMSEN 4B28

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: _____

Inventors (please provide full names): _____ *Please see the attachment*

Earliest Priority Filing Date: _____

**For Sequence Searches Only* Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.*

*please search compounds of types 1-4
for use in a photographic material (element)
Thank you.*

AB A silver halide **photog.** material comprises a non-**photosensitive** layer which contains a dispersion containing a hydroxyamide derivative $R_2C(:X)N(R_1)OH$ [R_1 = (substituted) C1-6 (cyclo)alkyl, aryl; R_2 = branched alkyl, linear or branched alkenyl, substituted alkyl, aryl; X = O, S] or an acylhydrazinobenzene derivative $R_4R_5NPhNNHNCOR_3$ [R_3 , R_5 = H, substituent; R_4 = SO_2R_6 , COR_6 , $SO_2N(R_6)_2$, $CON(R_6)_2$, $PO(OR_6)_3$; R_6 = substituent] as an agent trapping excess **developer** oxidation products. The **photog.** material may contains an imidazotriazole derivative as a magenta- or cyan coupler in a **photosensitive** emulsion layer adjacent to the non-**photosensitive** layer. The

photog. material provides images with good color reproducibility and storage characteristics.

AB A silver halide color **photog.** film comprises each at least one blue-, green-, and red-sensitive emulsion layer on a support. The film contains a magenta coupler of the formula I (R1 = t-alkyl; m1, m, n = 0-1; R2-R7 = H, halogen, alkyl, aryl, L = -NR8SO2-, -SO2NR8-, -SO2NR8CO-, -NR8COO-, -NR8CONR9-, -COO-; R8, R9 = H, alkyl, aryl; J = -CO-, -COO-, -O-, -S-, -CONR10-, -NR10CO-, -NR10COO-, -NR10NR11-, -SO2-, -SO2NR10-, or -CONR10SO2-; R10, R11 = H, alkyl, aryl; B = C1-70-alkyl, C6-70-aryl; p = 1-5; G = halogen, alkyl, aryl, alkoxy; q = 0-4). The inventive **silver halide color photosensitive film** has good color reproduction, high image fastness and produces little stain, and has improved in the storage stability and resistance to composition variations

in developers.

AB In the **photog.** material comprising a support coated with blue-, green-, and red-sensitive Ag halide emulsion layers, the red-sensitive emulsion layer contains a cyan coupler I or II (R1, R3 = electron withdrawing group with Hammett's $\sigma_p \geq 0.30$; R2, R4 = substituent; X1-2 = H, releasable group in the reaction with **developer**), which forms intramol. hydrogen bonds of 6-membered ring form at ≥ 2 positions when forming dye by the reaction with a **developer** oxide. The red-sensitive emulsion layer may contain some variations of cyan couplers. The material shows good coloring property and gives images with good lightfastness and color reproduction

AB In the process comprising the steps of developing a **photosensitive** material containing a **photosensitive** emulsion layer by heat at the presence of a base or a base precursor upon putting together with a processing sheet coated with a binder and then peeling off the processing sheet to form an image on the heat-sensitive material and/or the processing sheet, the **photo-sensitive** material comprises a coupler, which reacts with an acidic material from the light-sensitive emulsion layer to contribute to an image formation, or a coupler, which reacts with an acid material in the **developer** not contributing to an image formation, in the light-sensitive emulsion layer. The method provides good image discrimination and reproduction of the gradation.

AB The title material contains, in ≥ 1 of the hydrophilic colloid layers formed on a support, ≥ 1 coupler I (R1-3 = H or substituent; X = H, alkyl, aryl, sulfonyl, alkylthio, arylthio, aryloxy, cyano, heteroaryl, alkoxy, alkoxy carbonyl, carbamoyl, sulfamoyl, sulfonamido, carbonamido; G = aryloxy, heteroaryloxy, arylthio, carbamoyloxy, heteroarylthio, acyloxy, alkoxy carbonyloxy, aryloxy carbonyloxy) and ≥ 1 hydrazine-type color developing agent II (Z = carbamoyl, acyl, alkoxy carbonyl, aryloxy carbonyl; Q = atoms required to form an unsatd. ring along with the C atom). The material is heat-developed at 70-150° or developed in a solution or by developing with an alkaline processing solution to form an image. The coupler is colorless and diffusion

resistant and produces a high color quality diffusive dye rapidly with the color developing agent, and the material provides durable, high d. images.

AB The heat-developable color photosensitive material comprises ≥2 photosensitive emulsion layers containing a photosensitive silver halide , a binder, a				

coupler, and developers on a support. The each emulsion layer has spectral sensitivity toward a different light wave region and a practically non-photosensitive middle layer is interposed between the emulsion layers, wherein at least one of the middle layers contains a coupler which couples with the developer but which does not form a color image. The material provides improved image discrimination and improved color reproducibility without effecting on the other photog. characteristics.

AB A thermal development color photosensitive material possessing
at least a photosensitive silver halide, a

binder, a coupler, a reducing agent, and a sparingly water-soluble basic metal compound on a support is placed through a small quantity of H₂O on top of a sheet of a complexing agent containing a complexing agent against the metal ions of the basic metal compound on a support and subjected to thermal development to obtain color images on the **photosensitive** material, wherein the AgCl content ratio of the **photosensitive silver halide** grains is ≥ 80 mol%, and the complexing agent sheet contains phys. development nuclei and a silver halide solubilizing agent, and the reducing agent is at least one of compds. represented by N-sulfonyl-p-hydroxyaniline derivs. (I; R₁ - R₄ = H, halo, alkyl, aryl, alkylcarbonamido, arylcarbonamido, alkylsulfonamido, arylsulfonamido, alkoxy, aryloxy, arylthio, alkylcarbamoyl, arylcarbamoyl, CONH₂, alkylsulfamoyl, arylsulfamoyl, SO₂NH₂, cyano, alkylsulfonyl, arylsulfonyl, etc.; R₅ = alkyl, aryl, heterocyclyl), Z=CNHNHSO₂R₅ (Z = a group of atoms forming an aromatic or heterocyclic ring; when Z = benzene ring, a total of the Hammett consts. of the substituent is ≥ 1), Z=CNHNHCONHR₅ (Z, R₅ = same as above), sulfonylhydrazone derivs. (II; R₅ = same as above; R₆ = alkyl; R₇, R₈ = H, substituent), and carbamoylhydrazone derivs. (III; R₅ - R₈ = same as above). This imaging method is excellent in image discrimination and stability of color images after processing.

AB The title material contains at least one polymer coupler selected from a copolymer derived from a yellow coupler monomer represented by $Q^1(L^2)_j(L^1)iC(R^1):CH_2$ (I) [R^1 = alkyl, etc.; L^1 = CO_2 , etc.; L^2 = divalent linking moiety; i, j = 0 or 1; Q^1 = yellow coupler residue which reacts with an oxidized aromatic primary amine **developer** to form a yellow dye] and a magenta coupler monomer represented by $Q^2(L^4)_h(L^3)gC(R^3):CH_2$ (II) [R^3 = alkyl, etc.; L^3 = CO_2 , etc.; L^4 = divalent linking moiety; g, h = 0 or 1; Q^2 = magenta coupler residue which reacts with an oxidized aromatic primary amine **developer** to form a magenta dye] and a copolymer derived from monomer I, monomer II, and a non-color-forming monomer which has ≥ 1 ethylene group and which cannot react with an oxidized aromatic primary amine **developer**. A method for manufacturing color filter using the title material is also described. The use of the title material gives high quality images.

GI

AB A silver halide color photosensitive material possessing on a support at least one photog. constituent layer containing a reducing agent for coloration represented by formula R11NHNH-X-R12 (R11 = aryl, heterocyclyl; R12 = alkyl, alkenyl, alkynyl, aryl, heterocyclyl; X = SO2, CO, COCO, CO2, CONHR13, COCO2, COCONR13, SO2NR13; wherein R13 = H, group cited in R12), at least one color-forming coupler, and at least one high b.p. organic solvent having electron-donating parameter $\Delta vD \geq 80$ is claimed. Above reducing agent, e.g. N-phenylsemicarbazide (I), for coloration is oxidized by redox reaction with an auxiliary developer oxidized by exposed silver halide and its oxidized form further reacts with a color-forming coupler to form a dye. This photog. material enables low replenishment of a color developer and thereby allows processing with low discharge of a used color developer, provides good coloration even at low pH of the coating in rapid processing, and is reduced in stain during a long term storage and after processing.

AB In the title material comprising a support coated with ≥ 1 **photosensitive** emulsion layer (A) and ≥ 1 non-**photosensitive** emulsion layer (B), A and/or B layer contains a pyrazole coupler I [Z = nonmetallic atomic group required to form a (un)substituted N-containing heterocyclic ring; X = H, group being released by reaction with an oxidized color **developer**; R9 - R11 = substitute] or a phenol compound II (R1 = ballast group; R2 = C ≥ 2 alkyl; Z1 = H, atom or group being released by reaction with an oxidized color **developer**), and a hydroquinone compound III (R12 - R13 = sec- or tert-alkyl, total C of R12 and R13 is ≥ 20). The material has excellent storage stability with light resistance.

AB A multilayer color photog. material is described containing a ferromagnetic powder from $4 + 10^{-4}$ to 3 g/m^2 of the support with a green-sensitive layer containing a magenta coupler I [R1 = H, substituent; R2 = H, group that can be split off by coupling reaction with an oxidation product of a primary amine developer; Z1-Z3 = methine, N, NH, one of the 2 bonds between them is a single bond and the other is a double bond; the coupler may form a dimer or a polymer through R1 or R2 or

substituted methine of Z1-Z3]. The material makes it possible to shorten the printing time and has an excellent sharpness.

AB A Ag halide photosensitive material having ≥ 1 Ag halide emulsion layer on a support contains pyrazolotetrazole cyan coupler I (R = electron attractive group; X = H, substituents released by coupling)

reaction with an oxidized **developer**; Y = H, substituents). The coupler has excellent spectral absorption and the coupler-containing **photosensitive** material gives clear cyan-images. A red-sensitive emulsion layer containing Ag bromide chloride and a cyan coupler II and a protective layer containing gelatin and hardening agent of 2,4-dichloro-6-hydroxy-s-triazine Na salt were formed successively on a polyethylene-laminated support to give a red-sensitive color **photog.** material. Images obtained by exposure and development of the material had no irregular absorption in green color region. High heat and humidity resistance can be obtained.

AB The claimed **photog.** materials contain a compound of the formula Coup-Z-CD (Coup = coupler moiety; CD = color **developer** moiety or color **developer** precursor moiety; Z = a protective group for CD which releases the CD during development). The **developer** -releasing couplers have good stability; hence they do not cause desensitization, fog, or stain during manufacture or storage of the color **photog.** materials. Thus, a color **photog.** paper having a blue-sensitive layer, an interlayer, a green-sensitive layer, a 2nd interlayer, a red-sensitive layer, and a protective layer was prepared by adding I to the yellow-sensitive layer. The **photog.** paper showed low fog, high sensitivity, and a high Dmax.

AB The title material is composed of a support bearing blue-sensitive, green-sensitive, and red-sensitive Ag halide emulsion layers where the blue-sensitive layer contains ≥ 1 high reaction speed yellow coupler having a relative coupling reaction rate of ≥ 0.3 and the green-sensitive layer contains ≥ 1 pyrazolotriazole-type magenta coupler of the general formula I [R = halo or an organic group releasable on a coupling reaction with an oxidized developer; R1, R2 = H (either of R1, R2), alkyl, aryl, heterocyclyl, acylamino, alkylamino, anilino, alkoxy carbonyl, alkylthio]. The material allows for raw storage and rapid development with stable **photog.** performance, providing color images with suppressed fog. Thus, a polyethylene-laminated paper support was coated in sequence with a blue-sensitive Ag(Br,Cl) emulsion containing a yellow coupler II, a dyed gelatin layer, a green-sensitive Ag(Br,Cl) emulsion layer containing a magenta coupler III, a gelatin intermediate layer, a red-sensitive Ag(Br,Cl) emulsion layer containing a cyan coupler, a UV-absorbing layer, and a gelatin protective layer to form a color **photog.** paper. The paper was wedge-exposed, color-developed, and bleach-fixed to give a color image with high sensitivity and low fog in a relatively short development time.

AB The title material is composed of a support bearing a blue-sensitive layer containing Ag halide grains with an average size of 0.20-0.55 μm and green-sensitive and red-sensitive emulsion layers having AgBr-contents of 5-65 mol%. The green-sensitive layer contains ≥ 1 of the pyrazolotriazole-type magenta coupler represented by the general formula I [R = halo or an organic group releasable on coupling reaction with an oxide developer; R1, R2 = H (either of R1, R2), alkyl, aryl, heterocyclic ring, acylamino, alkylamino, anilino, alkoxycarbonyl, alkylthio]. The material permits rapid development with stable performance and provides high-quality images with suppressed fog. Thus, a polyethylene-laminated paper support was coated in sequence with a blue-sensitive AgBr0.8Cl0.2 emulsion (average grain size 0.5 μm) containing a yellow coupler, a gelatin intermediate layer, a green-sensitive AgBr0.6Cl0.4 emulsion layer (average grain size 0.4 μm) containing magenta coupler II, a gelatin layer, a red-sensitive AgBr0.6Cl0.4 (average grain size, 0.4 μm) emulsion containing a cyan coupler, a UV-absorbing layer, and a gelatin protective layer to form a color **photog.** paper. The paper was wedge-exposed, developed, and bleach-fixed to give a color image. Fluctuation in the image contrast (especially for the green-sensitive layer) by varying the KBr content of the **developer** composition, which should be minimized for rapid running processing, was much smaller compared to materials employing emulsions and magenta couplers differing from the above composition

AB Ag halide color **photog. photosensitive** materials contain couplers having hydroxyphenylcarbonyl groups. The couplers exhibit excellent coloration characteristics, and hence the **photog** materials do not require presence of development promoters such as PhCH2OH in **developers**. Thus, a **photog.** test film prepared by using the yellow coupler I was sensitometrically exposed and developed to give yellow dye images with high Dmax and small Dmin regardless of the type of color **developers** used.

AB Ag halide color photog. materials contain couplers with a ballast group I (R = halo, alkyl, aryl, heterocycle, OH, alkoxy, aryloxy, acrylamino, sulfonamino, carbamoyl, sulfamoyl, ureido, alkoxy carbonyl, alkoxy carbonylamino, sulfonyl, alkylthio, CN, NO₂, CO₂H; m = 1-4; n = 1,2). The photog. materials exhibits excellent coloration characteristics even when developers without coloration promoters (such as PhCH₂OH) are used. The film was sensitometrically exposed and developed to give cyan dye images having high D_{max} and γ-values regardless of the type of the color-developer used. Thus, a test photog. film was prepared by using a Ag(Br, Cl) photog. emulsion containing a cyan coupler II.
